

Experiment No: 1

Comparative Study of Low-Code Development versus Traditional Application Development Approaches

1. Aim

To study and compare traditional application development with low-code development in terms of process, speed, cost, flexibility, and maintenance.

2. Introduction to Traditional Approach

Traditional application development involves writing source code manually using programming languages, frameworks, and databases. It follows SDLC phases such as requirements, design, coding, testing, deployment, and maintenance.

3. Introduction to Low Code

Low-code development uses visual interfaces, drag-and-drop components, and minimal hand coding to build applications faster while reducing development effort.

4. Diagram for Stages in Traditional Approach

5. Diagram for Steps in Low-Code

Requirements

Visual Design

Drag-and-Drop Development

Configure Workflows

Testing

Deploy with One Click

Monitor & Update

6. Comparative Analysis

Aspect	Traditional	Low-Code
Coding	Extensive manual coding	Minimal coding
Development Time	Long	Short
Cost	High	Lower
Skill	Professional developers	Developers & citizen developers
Customization	Very high	Moderate to high
Maintenance	Manual	Platform-assisted
Deployment	Complex	Fast
Scalability	Excellent	Depends on platform

7. Result

The experiment successfully compared traditional and low-code development approaches. Traditional development provides maximum flexibility and control, whereas low-code enables faster development, lower cost, and rapid deployment, making it suitable for modern business applications.
